For the form of the lens we have r f f n 4.12 #Gx-1)/ r 2 4.12 / / 2.12 / s=--I-2.12 These data give a meniscus lens and Q, q the conjugate foci, as in the figure, drawn for a focal length of three inches. Again substituting n=--2.12 in the expression for m we have m=2.9 This is the same lens as before, with the concave surface towards the incident light, which diverges from q, and is refracted diverging accurately from the virtual focus Q. The values of m will be real for all values of n positive or negative respectively, greater than the above; but for such lenses m will have two values which give A = 0, and between these the aberration changes sign. It is useful to examine a case amongst the forms of lenses which have this property of two aplanatic foci, with the aberration changing sign as the geometrical focus of the refracted pencil passes from one side to the other of these points....
