Excerpt: . . . drugs safety in humans and to begin determination of appropriate dose levels and routes of administration. In phase II trials researchers gather additional information about the most effective way to administer the drug and about possible adverse effects, and they begin to assess its clinical potential. Phase III clinical trials are controlled field studies with larger numbers of patients to develop reasonable estimates of safety and efficacy. Two approaches have been used by scientists in the United States and abroad to accelerate the development of anti-AIDS drugs without bypassing established testing procedures. The first has been to examine the susceptibility of HTLV-III/LAV to drugs originally developed for other purposes. The benefit of this approach is that researchers can bypass toxicity studies in animal models and some of the early stages of clinical trials because they already know how the drug affects human tissues....
